HASTELLOY® : THE NAME TO TRUST

In aggressive/corrosive service, when nothing else works, many industries have traditionally turned to HASTELLOY® C-276 alloy. Many years of outstanding performance in a variety of industrial applications have confirmed the advantages of using the alloy. Materials engineers in the chemical processing and other industries have grown accustomed to specifying its high performance based on laboratory testing, field trials and/or prior experience.

Some "generic" alloy N10276 products fail to measure up to the performance industry expects from HASTELLOY C-276 alloy which is produced via exacting processes, and backed by years of experience in chemistry control, thermal-mechanical processing, testing and qualifications to rigid standards.

¹ ASTM G-28A = 50% $H_2SO_4 + 42g/I Fe_2 (SO_4)_3$ (Boiling)

² ASTM G-28B = 23% H_2SO_4 + 1.2% HCI + 1% Fe_2CI_3 + 1% $CuCI_2$ (Boiling)

³ GREEN DEATH = 11.5% H₂SO₄ + 1.2% HCl + 1% Fe₂Cl₃ + 1% CuCl₂ (Boiling)

When the alloy is specified by the UNS Number, discerning questions should be asked for assurance of HASTELLOY C-276 alloy performance:

- Does the product possess the clean, homogeneous microstructure so important for good resistance to aqueous corrosion?
- How does the product perform in tough environments (e.g., rigorous pitting conditions) for which this material is most often specified?
- Is the corrosion resistance of the welded product, in a discriminating test, up to par?

© 1997 by Haynes International, Inc.

PRINCIPAL FEATURES

Excellent Resistance to Corrosion

HASTELLOY® C-276 alloy is a nickel-molybdenum-chromium wrought allov that is generally considered a versatile corrosionresistant alloy. C-276 alloy is an improved wrought version of alloy C in that it usually doesn't need to be solution heat-treated after welding and has vastly improved fabricability. This alloy resists the formation of grain-boundary precipitates in the weld heataffected zone, thus making it suitable for most chemical process applications in the as-welded condition. However, in environments where attack of the C-276 alloy weld joint is experienced, C-22[®] weld filler materials should be considered (See page 14).

C-276 alloy has excellent resistance to localized corrosion and to both oxidizing and reducing media. Because of its versatility, C-276 alloy can be used where "upset" conditions are likely to occur or in multipurpose plants. HASTELLOY C-276 alloy has excellent resistance to a wide variety of chemical process on irromente including strong.

environments, including strong oxidizers such as ferric and cupric

chlorides, hot contaminated media (organic and inorganic), chlorine, formic and acetic acids, acetic anhydride, and seawater and brine solutions. It is used in flue gas desulfurization systems because of its excellent resistance to sulfur compounds and chloride ions encountered in most scrubbers. C-276 alloy has excellent resistance to pitting and to stresscorrosion cracking. It is also one of the few materials that withstands the corrosive effects of wet chlorine gas, hypochlorite and chlorine dioxide.

Fabricated by a Variety of Methods

HASTELLOY C-276 alloy can be forged, hot-upset and impact extruded. Although the alloy tends to work-harden, it can be successfully deep-drawn, spun, press formed or punched. All of the common methods of welding can be used to weld HASTELLOY C-276 alloy, although the oxyacetylene and submerged arc processes are not recommended when the fabricated item is intended for use in corrosion service. Special precautions should be taken to avoid excessive heat in-put.

Detailed fabricating information is

available in the booklet, "Fabrication of HAYNES® Corrosion-Resistant Alloys." Ask for booklet H-2010.

Available in Wrought Form

HASTELLOY C-276 alloy is available in the form of plate, sheet, strip, billet, bar, wire, covered electrodes, pipe, tubing, pipe fittings, flanges and fittings.

Heat-Treatment

Wrought forms of HASTELLOY C-276 alloy are furnished in the solution heat-treated condition unless otherwise specified. C-276 alloy is normally solution heattreated at 2050°F (1121°C) and rapid quenched. Parts which have been hot-formed should be solution heat-treated prior to final fabrication or installation, if possible.

ASME Boiler and Pressure Vessel Code

HASTELLOY C-276 alloy plate, sheet, strip, bar, tubing and pipe are covered by ASME specifications SB-574, SB-575, SB-619, SB-622 and SB-626 under UNS number N10276.

COMPARATIVE IMMERSION CRITICAL PITTING AND CRITICAL CREVICE-CORROSION TEMPERATURES IN OXIDIZING NaCI-HCI SOLUTION

The chemical composition of the solution used in this test is as follows: 4% NaCl + 0.1% Fe₂(SO₄)₃ + 0.021 M HCI. This solution contains 24,300 ppm chlorides and is acidic (pH2).

In both pitting and crevice-

corrosion testing the solution temperature was varied in 5°C increments to determine the lowest temperature at which pittingcorrosion initiated (observed by examination at a magnification of 40X of duplicate samples) after a

24-hour exposure period (Pitting Temperature), and the lowest temperature at which crevicecorrosion initiated in a 100-hour exposure period (Crevice-Corrosion Temperature).

COMPARATIVE CRITICAL PITTING TEMPERATURES IN OXIDIZING H₂SO₄-HCI SOLUTION

The chemical composition of the solution used in this test is as follows: 11.5% H₂SO₄ + 1.2% HCl + 1% FeCl₃ + 1% CuCl₂. This test environment is a severely oxidizing acid solution which is used to evaluate the resistance of

alloys to localized corrosion. It is considerably more aggressive than the oxidizing NaCI-HCI test. Experiments were performed in increments of solution temperature of 5 deg. C for a 24hour exposure period to determine the critical pitting temperature, i.e. the lowest temperature at which pitting corrosion initiated (observed at a magnification of 40X of duplicate samples.)

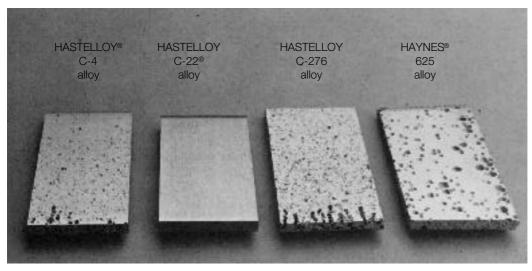

Critical Pitt	ing Temperature

HASTELLOY ALLOYS EXCEL IN PITTING RESISTANCE

As a class, C-type alloys excel in pitting corrosion resistance.

However, comparison tests in a severe pitting environment show

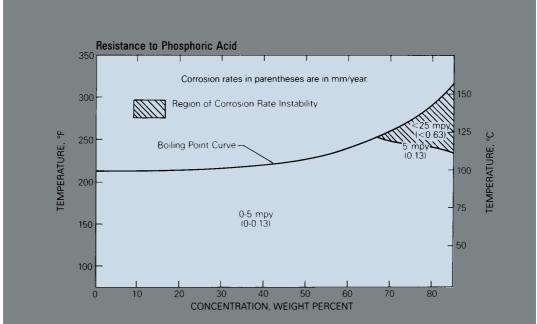

HASTELLOY C-22 alloy to be in a class by itself.

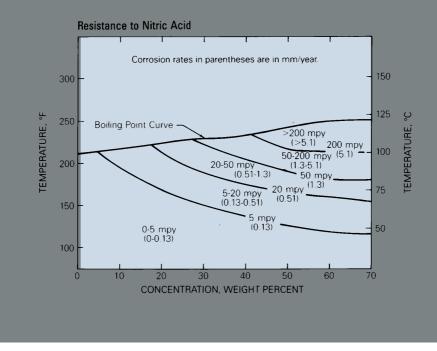

Samples were subjected to a solution of 11.5% H_2SO_4 + 1.2% HCl + 1% $FeCl_3$ + 1% $CuCl_2$. Solutions for coupons 625 and C-4 were at 102°C, while C-276 and C-22 were at 125°C.

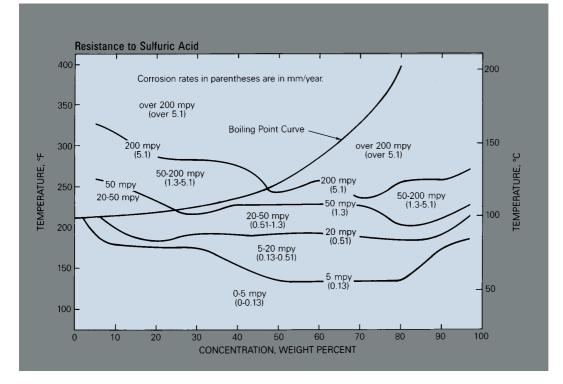

ISOCORROSION DIAGRAMS

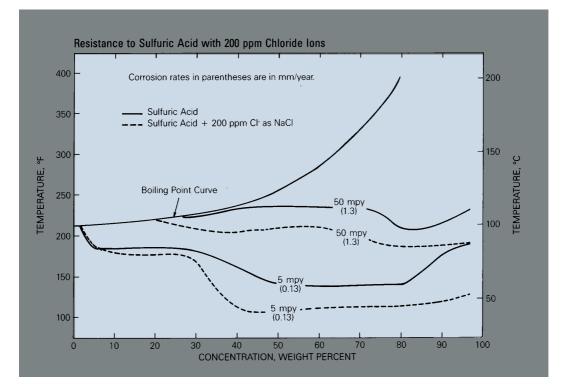

The isocorrosion diagrams shown on this and subsequent pages were plotted using data obtained in laboratory tests in reagent grade acids. These data should be used only as a guide. It is recommended that samples be tested under actual plant conditions.

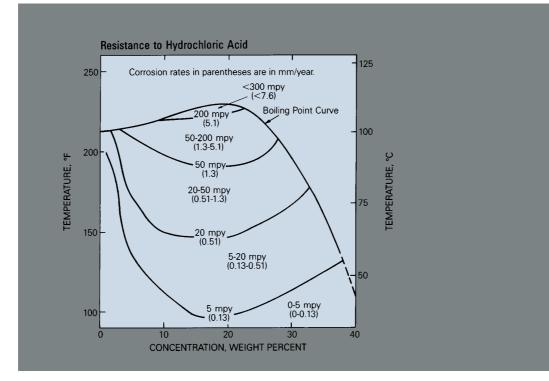

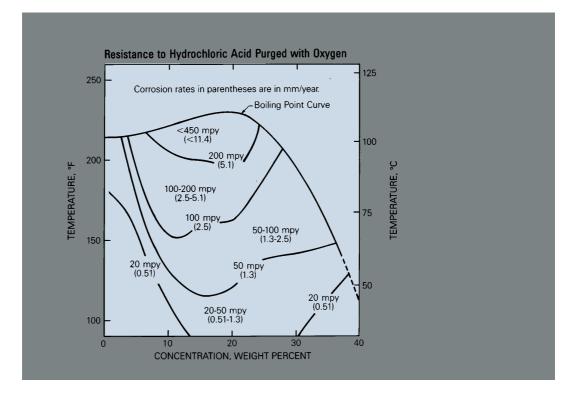

*All test specimens were heat-treated at 2050°F (1121°C), rapid quenched and in the unwelded condition.

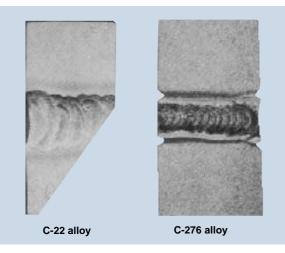

Improved Corrosion Resistance of HASTELLOY® C-22® Weldments

Corrosion behavior of welded samples showing the improved performance of C-22 alloy over that of C-276 alloy.

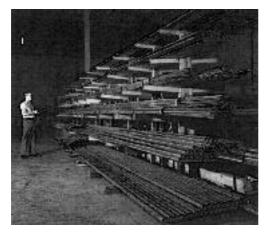

Weld overlays of HASTELLOY C-22 alloy, used to protect C-276 alloy weldments, can be seen on bleach plant mixer.

Service and Availability are Paramount at Haynes International, Inc.

Over 2-million pounds of finished-goods inventory of high performance alloys is maintained by Haynes International, Inc. This is believed to be the largest in the industry. Seven world-wide service centers are linked by a computer "browsing" system which

Supplies of corrosion-resistant alloy plate are stockpiled in the Haynes International, Inc. Houston service center to serve the surrounding chemical process industry.

Pipe and tubing are other items available for immediate delivery from Houston.

enables any one center to access availability information from all of the others. Haynes International is dedicated, through this network, to the prompt fulfillment of customer requirements.

One-half inch x 12 ft. shear at Windsor, Connecticut service center supplies customers in the northeast with sheet and light plate, cut-to-size.

Large stocks of alloy mill products are also maintained at the Kokomo service center.

Billet awaits shipment to nearby forge shop at Haynes International, Inc. service center in Anaheim, California.
